In []: `#Saving our plot`

In []: `#We can then use the figure.Figure.savefig() in order to save the figure to disk. Note that there are several useful flags we'll show below:`

In []: `# transparent=True makes the background of the saved figure transparent if the format supports it.
dpi=80 controls the resolution (dots per square inch) of the output.
bbox_inches='tight' fits the bounds of the figure to our plot.
Uncomment this line to save the figure.
Fig.savefig('sales.png', transparent=False, dpi=80, bbox_inches='tight')`

In []: `#Customizing Matplotlib with style sheets and rcParams`

In []: `#The style package adds support for easy-to-switch plotting "styles" with the same parameters as a matplotlib rc file (which is read at startup to configure matplotlib).`

In [37]: `import numpy as np
import matplotlib.pyplot as plt
import matplotlib as plt
plt.style.use('ggplot')
data = np.random.randn(50)`

In []: `#To list all available styles, use:`

In [38]: `print(plt.style.available)`

In []: `['bmh', 'classic', 'dark_background', 'fast', 'fivethirtyeight', 'ggplot', 'grayscale', 'seaborn-bright', 'seaborn-colorblind', 'seaborn-dark-palette', 'seaborn-dark', 'seaborn-darkgrid', 'seaborn-deep', 'seaborn-muted', 'seaborn-notebook', 'seaborn-paper', 'seaborn-pastel', 'seaborn-poster', 'seaborn-talk', 'seaborn-ticks', 'seaborn-white', 'seaborn-whitegrid', 'seaborn', 'Solarize_Light2', 'tableau-colorblind10', '_classic_test']`

In []: `#Defining your own style
#You can create custom styles and use them by calling style.use with the path or URL to the style sheet.
#For example, you might want to create mpl_configdir/stylelib/presentation.mplstyle with the following:
#axes.titlesize : 24
#axes.labelsize : 20
#lines.linewidth : 3
#lines.markersize : 10
#xtick.labelsize : 16
#ytick.labelsize : 16
#Then, when you want to adapt a plot designed for a paper to one that looks good in a presentation,
#you can just add:
#import matplotlib.pyplot as plt
#plt.style.use('presentation')`

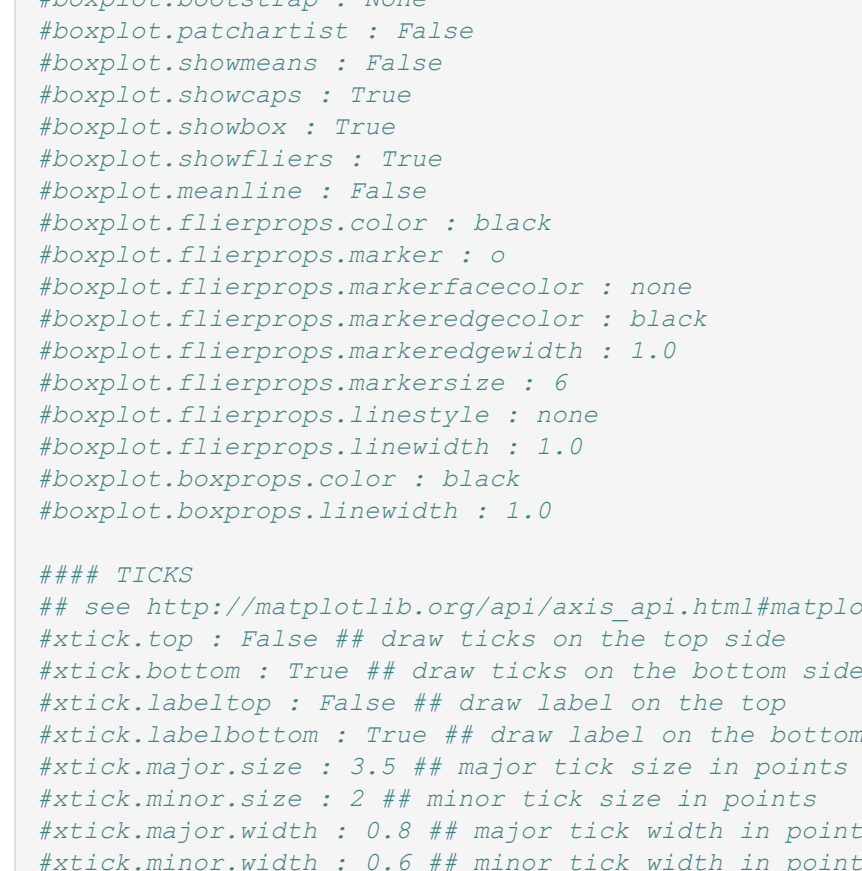

In []: `#Composing styles`

In []: `#Style sheets are designed to be composed together. So you can have a style sheet that customizes colors and a separate style sheet that alters element sizes for presentations. These helper methods will take your data (e.g., numpy arrays and strings) and create primitiveArtist instance. For example, you can pass a list of styles:
#import matplotlib.pyplot as plt
#plt.style.use(['dark_background', 'presentation'])`

In []: `#Temporary styling`

In [44]: `#If you only want to use a style for a specific block of code but don't want to change the global styling, the style package provides a context manager for limiting your changes to a specific scope. To isolate your styling changes, you can write something like the following:`

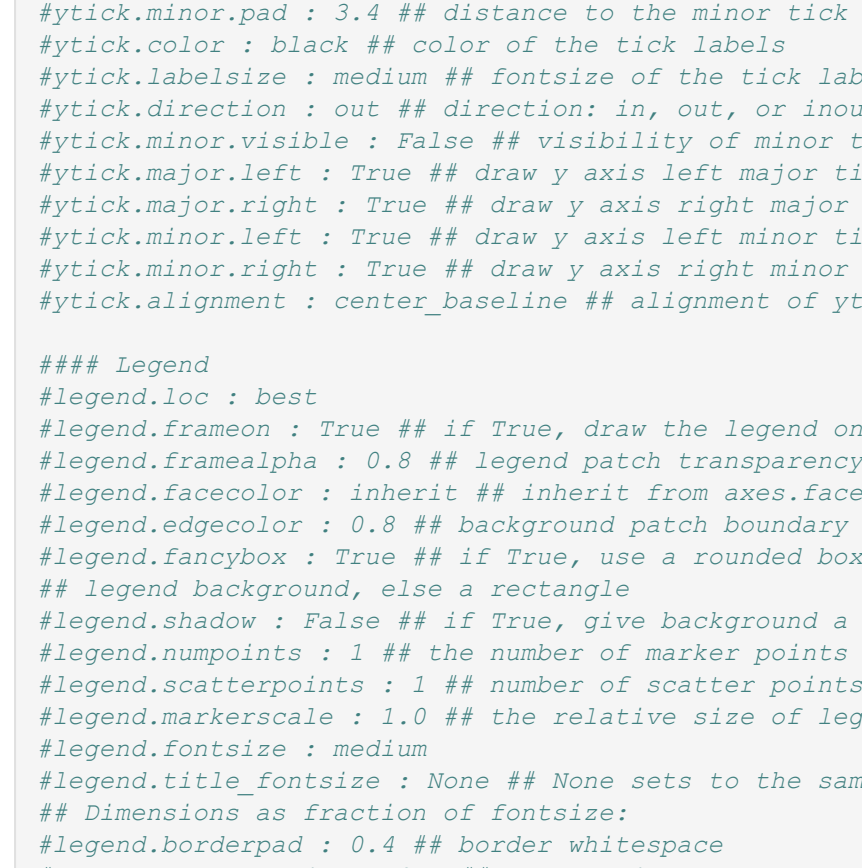

```
with plt.style.context('dark_background'):
    plt.plot(np.sin(np.linspace(0, 2 * np.pi)), 'r-o')
plt.show()
```

In []: `#matplotlib rcParams`

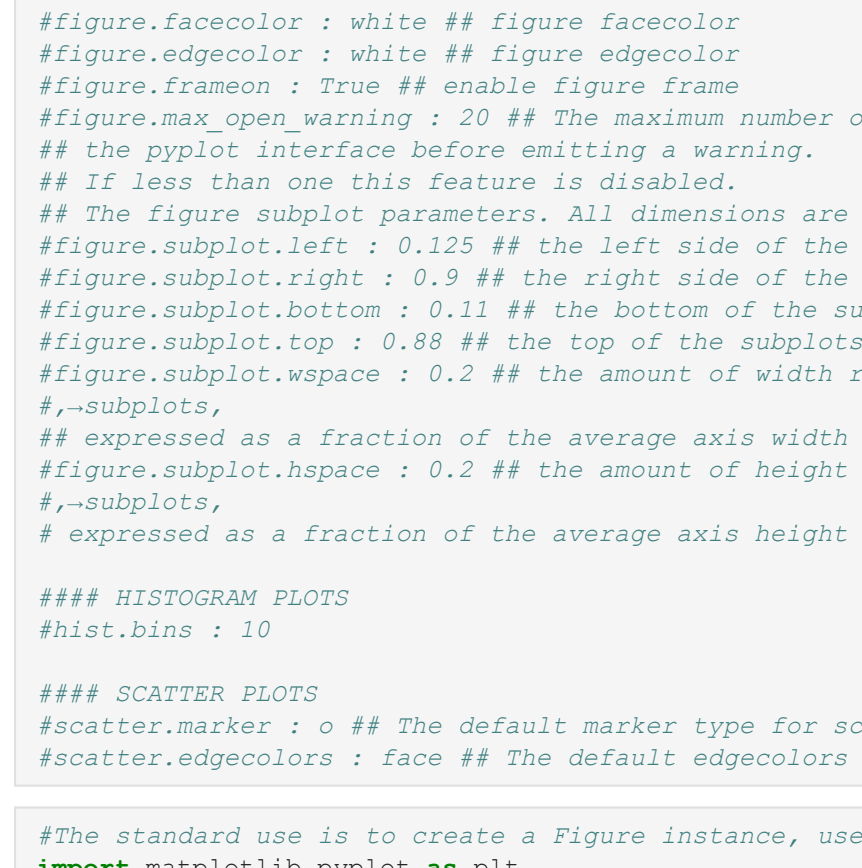

In [48]: `#You can also dynamically change the default rc settings in a python script or interactively from the python shell. All of the rc settings are stored in a dictionary-like variable called matplotlib.rcParams, which is global to the matplotlib package. rcParams can be modified directly, for example`

```
mpl.rcParams['lines.linewidth'] = 2
mpl.rcParams['lines.color'] = 'g'
plt.plot(data)
plt.show()
```

In [53]: `#Matplotlib also provides a couple of convenience functions for modifying rc settings. The matplotlib.rc() command can be used to modify multiple settings in a single group at once, using keyword arguments:`

```
mpl.rc('lines', linewidth=3, color='g')
plt.plot(data)
plt.show()
```
